5.1 API reference

Modules

- Utilities
- String
- String map
- HTTP server

5.1.1 Detailed Description

The API reference grouped by feature.

5.2 Utilities

Typedefs

- typedef void(* sg_err_cb) (void *cls, const char *err)
- typedef size_t(* sg_write_cb) (void *handle, uint64_t offset, const char *buf, size_t size)
- typedef ssize_t(* sg_read_cb) (void *handle, uint64_t offset, char *buf, size_t size)
- typedef void(* sg_free_cb) (void *handle)
- typedef int(* sg_save_cb) (void *handle, bool overwritten)
- typedef int(* sg_save_as_cb) (void *handle, const char *path, bool overwritten)

Functions

- unsigned int sg_version (void)
- const char * sg_version_str (void)
- void * sg_alloc (size_t size) __attribute__((malloc))
- void * sg_realloc (void *ptr, size_t size) __attribute__((malloc))
- void sg_free (void *ptr)
- char * sg_strerror (int errnum, char *str, size_t len)
- bool sg_is_post (const char *method)
- char * sg_tmpdir (void)

5.2.1 Detailed Description

All utility functions of the library.

5.2.2 Typedef Documentation

5.2.2.1 sg_err_cb

```
typedef void(* sg_err_cb) (void *cls, const char *err)
```

Callback signature used by functions that handle errors.

Parameters

out	cls	User-defined closure.
out	err	Error message.

5.2.2.2 sg_write_cb

```
typedef size_t(* sg_write_cb) (void *handle, uint64_t offset, const char *buf, size_t size)
```

Callback signature used by functions that write streams.

5.2 Utilities 5

Parameters

out	handle	Stream handle.	
out	offset	Current stream offset.	
out	buf	Current buffer to be written.	
out	size	Size of the current buffer to be written.	

Returns

Total written buffer.

5.2.2.3 sg_read_cb

typedef ssize_t(* sg_read_cb) (void *handle, uint64_t offset, char *buf, size_t size)

Callback signature used by functions that read streams.

Parameters

out	handle	Stream handle.
out	offset	Current stream offset.
out	buf	Current read buffer.
out	size	Size of the current read buffer.

Returns

Total read buffer.

5.2.2.4 sg_free_cb

typedef void(* sg_free_cb) (void *handle)

Callback signature used by functions that free streams.

Parameters

out	handle	Stream handle.

5.2.2.5 sg_save_cb

typedef int(* sg_save_cb) (void *handle, bool overwritten)

Callback signature used by functions that save streams.

Parameters

out	handle	Stream handle.
out	overwritten	Overwrite an already existed stream.

Return values

0	- Success.
E <error></error>	- User-defined error to abort the saving.

5.2.2.6 sg_save_as_cb

```
typedef int(* sg_save_as_cb) (void *handle, const char *path, bool overwritten)
```

Callback signature used by functions that save streams. It allows to specify the destination file path.

Parameters

out	handle	Stream handle.
out	path	Absolute path to store the stream.
out	overwritten	Overwrite an already existed stream.

Return values

0	- Success.
E <error></error>	- User-defined error to abort the saving.

5.2.3 Function Documentation

5.2.3.1 sg_version()

Returns the library version number.

Returns

Library version packed into a single integer.

5.2 Utilities 7

5.2.3.2 sg_version_str()

Returns the library version number as string.

Returns

Library version packed into a null-terminated string.

5.2.3.3 sg_alloc()

Allocates a new zero-initialize memory space.

Parameters

in	size	Memory size to be allocated.
----	------	------------------------------

Returns

Pointer of the zero-initialized allocated memory.

Return values

NULL	If size is 0 or no memory space.

Examples:

```
example_httpsrv_tls_cert_auth.c.
```

5.2.3.4 sg_realloc()

Reallocates an existing memory block.

in,out	ptr	Pointer of the memory to be reallocated.
in	size	Memory size to be reallocated.

Returns

Pointer of the reallocated memory.

Note

```
Equivalent to realloc(3).
```

```
5.2.3.5 sg_free()
```

```
void sg\_free ( void * ptr )
```

Frees a memory space previously allocated by sg_alloc() or sg_realloc().

Parameters

in	ptr	Pointer of the memory to be freed.
----	-----	------------------------------------

Examples:

```
example_httpsrv_tls_cert_auth.c.
```

5.2.3.6 sg_strerror()

```
char* sg_strerror (
    int errnum,
    char * str,
    size_t len )
```

Returns string describing an error number.

Parameters

in	errnum	Error number.
in	str	Pointer of a string to store the error message.
in	len	Length of the error message.

Returns

Pointer to str .

Examples:

```
example_httpsrv_tls_cert_auth.c, and example_httpuplds.c.
```

5.2 Utilities 9

5.2.3.7 sg_is_post()

Checks if a string is a HTTP post method.

Parameters

	in	method	Null-terminated string.
--	----	--------	-------------------------

Returns

 $\verb|true| if method| is POST, PUT, DELETE| or OPTIONS.$

5.2.3.8 sg_tmpdir()

```
char* sg_tmpdir (
     void )
```

Returns the system temporary directory.

Returns

Temporary directory as null-terminated string.

Return values

NULL If no memory space is available.

Examples:

 $example_httpuplds.c.$

5.3 String

Data Structures

• struct sg_str

Functions

```
    struct sg_str * sg_str_new (void) __attribute__((malloc))
```

- void sg_str_free (struct sg_str *str)
- int sg_str_write (struct sg_str *str, const char *val, size_t len)
- int sg_str_printf_va (struct sg_str *str, const char *fmt, va_list ap)
- int sg_str_printf (struct sg_str *str, const char *fmt,...) __attribute__((format(printf
- int const char * sg_str_content (struct sg_str *str)
- size_t sg_str_length (struct sg_str *str)
- int sg_str_clear (struct sg_str *str)

5.3.1 Detailed Description

String handle and its related functions.

5.3.2 Function Documentation

Creates a new zero-initialized string handle.

Returns

String handle.

Warning

It exits the application if called when no memory space is available.

Examples:

example_httpuplds.c, and example_str.c.

Frees the string handle previously allocated by sg_str_new().

5.3 String 11

Parameters

in	str	Pointer of the string handle to be freed.
----	-----	---

Examples:

example_httpuplds.c, and example_str.c.

5.3.2.3 sg_str_write()

Writes a null-terminated string to the string handle str. All strings previously written are kept.

Parameters

in	str	String handle.
in	val	String to be written.
in	len	Length of the string to be written.

Return values

0	- Success.
EINVAL	- Invalid argument.

5.3.2.4 sg_str_printf_va()

Prints a null-terminated formatted string from the argument list to the string handle ${\tt str}$.

Parameters

in	str	String handle.
in	fmt	Formatted string (following the same printf() format specification).
in	ар	Arguments list (handled by va_start()/va_end()).

Return values

0	- Success.

Return values

EINVAL	- Invalid argument.
--------	---------------------

5.3.2.5 sg_str_printf()

Prints a null-terminated formatted string to the string handle str. All strings previously written are kept.

Parameters

in	str	String handle.
in	fmt	Formatted string (following the same printf() format specification).
in		Additional arguments (following the same printf() arguments specification).

Return values

0	- Success.
EINVAL	- Invalid argument.

Examples:

example_httpuplds.c, and example_str.c.

5.3.2.6 sg_str_content()

```
int const char* sg\_str\_content ( struct \ sg\_str * str )
```

Returns the null-terminated string content from the string handle str.

Parameters

in	str	String handle.

Returns

Content as null-terminated string.

5.3 String 13

Return values

NULL	If the str is null and sets the errno to EINVAL.	
------	--	--

Examples:

example_httpuplds.c, and example_str.c.

5.3.2.7 sg_str_length()

Returns the total string length from the handle str.

Parameters

in <i>str</i>	String handle.
---------------	----------------

Returns

Total string length.

Return values

```
EINVAL - Invalid argument.
```

5.3.2.8 sg_str_clear()

```
int sg_str_clear ( struct \ sg\_str * \ str )
```

Cleans all existing content in the string handle ${\tt str.}$

Parameters

in	str	String handle.

Return values

0	- Success.
EINVAL	- Invalid argument.

example_httpuplds.c.

5.4 String map 15

5.4 String map

Data Structures

· struct sg strmap

Typedefs

- typedef int(* sg_strmap_iter_cb) (void *cls, struct sg_strmap *pair)
- typedef int(* sg_strmap_sort_cb) (void *cls, struct sg_strmap *pair_a, struct sg_strmap *pair_b)

Functions

- const char * sg_strmap_name (struct sg_strmap *pair)
- const char * sg_strmap_val (struct sg_strmap *pair)
- int sg_strmap_add (struct sg_strmap **map, const char *name, const char *val)
- int sg_strmap_set (struct sg_strmap **map, const char *name, const char *val)
- int sg_strmap_find (struct sg_strmap *map, const char *name, struct sg_strmap **pair)
- const char * sg_strmap_get (struct sg_strmap *map, const char *name)
- int sg_strmap_rm (struct sg_strmap **map, const char *name)
- int sg_strmap_iter (struct sg_strmap *map, sg_strmap_iter_cb cb, void *cls)
- int sg_strmap_sort (struct sg_strmap **map, sg_strmap_sort_cb cb, void *cls)
- unsigned int sg_strmap_count (struct sg_strmap *map)
- int sg_strmap_next (struct sg_strmap **next)
- void sg_strmap_cleanup (struct sg_strmap **map)

5.4.1 Detailed Description

String map handle and its related functions.

5.4.2 Typedef Documentation

5.4.2.1 sg_strmap_iter_cb

```
typedef int(* sg_strmap_iter_cb) (void *cls, struct sg_strmap *pair)
```

Callback signature used by sg_strmap_iter() to iterate pairs of strings.

out	cls	User-defined closure.
out	pair	Current iterated pair.

5.4.2.2 sg_strmap_sort_cb

```
\label{typedef}  \mbox{typedef int (* sg_strmap_sort_cb) (void *cls, struct sg_strmap *pair_a, struct sg_strmap *pair_b)}
```

Callback signature used by sg_strmap_sort() to sort pairs of strings.

Parameters

out	cls	User-defined closure.
out	pair⇔	Current left pair (A).
	_a	
out	pair⊷	Current right pair (B).
	_b	

5.4.3 Function Documentation

5.4.3.1 sg_strmap_name()

Returns a name from the pair.

Parameters

in	pair	Pair of name-value.
----	------	---------------------

Returns

Name as null-terminated string.

Return values

```
NULL If the pair is null and sets the errno to EINVAL.
```

Examples:

example_strmap.c.

5.4.3.2 sg_strmap_val()

Returns a value from the pair.

5.4 String map 17

Parameters

in <i>pair</i> Pair of name-value.

Returns

Value as null-terminated string.

Return values

```
NULL If the pair is null and sets the errno to EINVAL.
```

Examples:

example_strmap.c.

5.4.3.3 sg_strmap_add()

Adds a pair of name-value to the string map.

Parameters

in,out	тар	Pairs map pointer to add a new pair.
in	name	Pair name.
in	val	Pair value.

Return values

0	- Success.
EINVAL	- Invalid argument.

Note

It cannot check if a name already exists in a pair added to the map, then the uniqueness must be managed by the application.

Warning

It exits the application if called when no memory space is available.

5.4.3.4 sg_strmap_set()

Sets a pair of name-value to the string map.

Parameters

in,out	map	Pairs map pointer to set a new pair.
in	name	Pair name.
in	val	Pair value.

Return values

0	- Success.
EINVAL	- Invalid argument.

Note

If a name already exists in a pair previously added into the map, then the function replaces its value, otherwise it is added as a new pair.

Warning

It exits the application if called when no memory space is available.

Examples:

example_strmap.c.

5.4.3.5 sg_strmap_find()

Finds a pair by name.

in	тар	Pairs map.
in	name	Name to find the pair.
in,out	pair	Pointer to store the found pair.

5.4 String map 19

Return values

0	- Success.
EINVAL	- Invalid argument.
ENOENT	- Pair not found.

Examples:

example_strmap.c.

5.4.3.6 sg_strmap_get()

Gets a pair by name and returns the value.

Parameters

in	map	Pairs map.
in	name	Name to get the pair.

Returns

Pair value.

Return values

```
NULL If map or name is null or pair is not found.
```

Examples:

example_httpcookie.c, and example_httpuplds.c.

5.4.3.7 sg_strmap_rm()

Removes a pair by name.

in	map	Pointer to the pairs map.	
in	name	Name to find and then remove the pair.	

Return values

0	- Success.
EINVAL	- Invalid argument.
ENOENT	- Pair already removed.

5.4.3.8 sg_strmap_iter()

Iterates over pairs map.

Parameters

in	тар	Pairs map.
in	cb	Callback to iterate the pairs.
in,out	cls	User-specified value.

Return values

0	- Success.
EINVAL	- Invalid argument.

Returns

Callback result when it is different from 0.

Examples:

```
example_strmap.c.
```

5.4.3.9 sg_strmap_sort()

Sorts the pairs map.

in,out	тар	Pointer to the pairs map.
in	cb	Callback to sort the pairs.
in, out	cls	User-specified value.

5.4 String map 21

Return values

0	- Success.
EINVAL	- Invalid argument.

Examples:

example_strmap.c.

5.4.3.10 sg_strmap_count()

```
unsigned int sg_strmap_count ( struct \ sg\_strmap * \textit{map} )
```

Counts the total pairs in the map.

Parameters

in <i>map</i>	Pairs map.
---------------	------------

Returns

Total of pairs.

Return values

0 If the list is empty or null.

5.4.3.11 sg_strmap_next()

Returns the next pair in the map.

Parameters

in,out	next	Pointer to the next pair.

Return values

0	- Success.
EINVAL	- Invalid argument.

5.4.3.12 sg_strmap_cleanup()

Cleans the entire map.

Parameters

in map Pointer to t	he pairs map.
---------------------	---------------

Examples:

example_strmap.c.

5.5 HTTP server 23

5.5 HTTP server

Data Structures

- struct sg httpauth
- struct sg_httpupld
- struct sg_httpreq
- struct sg httpres
- struct sg_httpsrv

Macros

#define sg_httpres_send(res, val, content_type, status) sg_httpres_sendbinary((res), (void *) (val), ((val != NULL) ? strlen((val)) : 0), (content_type), (status))

Typedefs

- typedef bool(* sg_httpauth_cb) (void *cls, struct sg_httpauth *auth, struct sg_httpreq *req, struct sg_httpres *res)

- ssize_t sg_httpread_end (bool err)

5.5.1 Detailed Description

Fast event-driven HTTP server.

5.5.2 Macro Definition Documentation

5.5.2.1 sg_httpres_send

Sends a null-terminated string content to the client.

5.5 HTTP server 25

Parameters

in	res	Response handle.
in	val	Null-terminated string.
in	content_type	Content-Type of the content.
in	status	HTTP status code.

Return values

0	- Success.
EINVAL	- Invalid argument.
EALREADY	- Operation already in progress.

Warning

It exits the application if called when no memory space is available.

Examples:

example_httpauth.c, example_httpcookie.c, example_httpsrv.c, example_httpsrv_tls_cert_auth.c, and example_httpuplds.c.

5.5.3 Typedef Documentation

5.5.3.1 sg_httpauth_cb

```
typedef bool(* sg_httpauth_cb) (void *cls, struct sg_httpauth *auth, struct sg_httpreq *req,
struct sg_httpres *res)
```

Callback signature used to grant or deny the user access to the server resources.

Parameters

out	cls	User-defined closure.
out	auth	Authentication handle.
out	req	Request handle.
out	res	Response handle.

Return values

true	Grants the user access.
false	Denies the user access.

5.5.3.2 sg_httpupld_cb

typedef int(* sg_httpupld_cb) (void *cls, void **handle, const char *dir, const char *field,

const char *name, const char *mime, const char *encoding)

Callback signature used to handle uploaded files and/or fields.

Parameters

out	cls	User-defined closure.
in,out	handle	Stream handle pointer.
out	dir	Directory to store the uploaded files.
out	field	Posted field.
out	name	Uploaded file name.
out	mime	Uploaded file content-type (e.g.: text/plain, image/png,
		application/json etc.).
out	encoding	Uploaded file transfer-encoding (e.g.: chunked, deflate, gzip etc.).

Return values

0	- Success.
E <error></error>	- User-defined error to refuse the upload.

5.5.3.3 sg_httpuplds_iter_cb

```
typedef int(* sg_httpuplds_iter_cb) (void *cls, struct sg_httpupld *upld)
```

Callback signature used to iterate uploaded files.

Parameters

out	cls	User-defined closure.
out	upld	Current upload item.

Return values

0	- Success.
E <error></error>	- User-defined error to stop list iteration.

5.5.3.4 sg_httpreq_cb

```
typedef void(* sg_httpreq_cb) (void *cls, struct sg_httpreq *req, struct sg_httpres *res)
```

Callback signature used to handle requests and responses.

out	cls	User-defined closure.
out	req	Request handle.
out	res	Response handle.

5.5 HTTP server 27

5.5.4 Function Documentation

5.5.4.1 sg_httpauth_set_realm()

Sets the authentication protection space (realm).

Parameters

in	auth	Authentication handle.
in	realm	Realm string.

Return values

0	- Success.
EINVAL	- Invalid argument.
EALREADY	- Realm already set.

Warning

It exits the application if called when no memory space is available.

Examples:

example_httpauth.c.

5.5.4.2 sg_httpauth_realm()

```
\begin{tabular}{ll} const char* sg_httpauth_realm ( \\ struct sg_httpauth * auth ) \end{tabular}
```

Gets the authentication protection space (realm).

Parameters

in	auth	Authentication handle.

Returns

Realm as null-terminated string.

Return values

NULL If auth is null and sets the errno to	EINVAL.	
--	---------	--

5.5.4.3 sg_httpauth_deny()

Deny the authentication sending a justification to the user.

Parameters

in	auth	Authentication handle.
in	justification	Justification message.
in	content_type	Content-Type of the justification.

Return values

0	- Success.
EINVAL	- Invalid argument.
EALREADY	- Already denied.

Examples:

```
example_httpauth.c.
```

5.5.4.4 sg_httpauth_cancel()

Cancels the authentication loop while the user is trying to acess the server.

Parameters

i	n	auth	Authentication handle.
---	---	------	------------------------

Return values

0	- Success.
EINVAL	- Invalid argument.

5.5 HTTP server 29

5.5.4.5 sg_httpauth_usr()

Returns the authentication user.

Parameters

in	auth	Authentication handle.
----	------	------------------------

Returns

User as null-terminated string.

Return values

```
NULL If auth is null and sets the errno to EINVAL.
```

Examples:

example_httpauth.c.

5.5.4.6 sg_httpauth_pwd()

Returns the authentication password.

Parameters

in	auth	Authentication handle.
T11	autii	Authentication nation.

Returns

Password as null-terminated string.

Return values

NULL If auth is null and sets the errno to EINVAL.

Examples:

example_httpauth.c.

5.5.4.7 sg_httpuplds_iter()

Iterates over all the upload items in the uplds list.

Parameters

in	uplds	Uploads list handle.
in	cb	Callback to iterate over upload items.
in	cls	User-defined closure.

Return values

0	- Success.	
EINVAL	- Invalid argument.	
E <error></error>	- User-defined error to abort the list iteration.	

5.5.4.8 sg_httpuplds_next()

```
int sg_httpuplds_next ( struct \ sg_httpupld \ ** \ upld \ )
```

Gets the next upload item starting from the first item pointer upld.

Parameters

in,out	upld	Next upload item starting from the first item pointer.

Return values

0	- Success.
EINVAL	- Invalid argument.

Examples:

 $example_httpuplds.c.$

5.5.4.9 sg_httpuplds_count()

```
unsigned int sg_httpuplds_count ( {\tt struct \ sg\_httpupld * \it uplds} \ )
```

5.5 HTTP server 31 Counts the total upload items in the list ${\tt uplds}.$

Parameters

Returns

Total of items.

Return values

```
0 If the list is empty or null.
```

5.5.4.10 sg_httpupId_handle()

Returns the stream handle of the upload handle upld.

Parameters

in upld Upload handle.

Returns

Stream handle.

Return values

```
NULL If upld is null and sets the errno to EINVAL.
```

5.5.4.11 sg_httpupId_dir()

Returns the directory of the upload handle upld.

in	upld	Upload handle.

5.5 HTTP server 33

Returns

Upload directory as null-terminated string.

Return values

NULL If upld is null and sets the errno to EINVAL.

5.5.4.12 sg_httpupId_field()

Returns the field of the upload handle upld.

Parameters

in <i>upld</i> Upload handle.

Returns

Upload field as null-terminated string.

Return values

NULL If upld is null and sets the errno to EINVAL.

5.5.4.13 sg_httpupId_name()

Returns the name of the upload handle upld.

Parameters

in	upld	Upload handle.
----	------	----------------

Returns

Upload name as null-terminated string.

Return values

NULL If upld is null and sets the errno to EINVAL.

Examples:

example_httpuplds.c.

5.5.4.14 sg_httpupId_mime()

Returns the MIME (content-type) of the upload.

Parameters

in	upld	Upload handle.
	,	

Returns

Upload MIME as null-terminated string.

Return values

NULL If upld is null and sets the errno to EINVAL.

5.5.4.15 sg_httpupId_encoding()

```
\begin{tabular}{ll} const char* sg_httpupld_encoding ( \\ struct sg_httpupld * upld ) \end{tabular}
```

Returns the encoding (transfer-encoding) of the upload.

Parameters

in	upld	Upload handle.
----	------	----------------

Returns

Upload encoding as null-terminated string.

Return values

NULL If upld is null and sets the errno to EINVAL.

5.5.4.16 sg_httpupId_size()

Returns the size of the upload.

Parameters

in <i>upld</i>	Upload handle.
----------------	----------------

Returns

Upload size into $\verb"uint64"$. If $\verb"upld"$ is null, sets the $\verb"errno"$ to $\verb"EINVAL"$.

5.5.4.17 sg_httpupId_save()

Saves the uploaded file defining the destination path by upload name and directory.

Parameters

in	upld	Upload handle.
in	overwritten	Overwrite upload file if it exists.

Return values

0	- Success.	
EINVAL	- Invalid argument.	
EEXIST	- File already exists (if overwritten is false).	
EISDIR	- Destination file is a directory.	

Examples:

example_httpuplds.c.

5.5.4.18 sg_httpupId_save_as()

Saves the uploaded file allowing to define the destination path.

Parameters

in	upld	Upload handle.
in	path	Absolute destination path.
in	overwritten	Overwrite upload file if it exists.

Return values

0	- Success.	
EINVAL	- Invalid argument.	
EEXIST	- File already exists (if overwritten is true).	
EISDIR	- Destination file is a directory.	

5.5.4.19 sg_httpreq_headers()

Returns the client headers into sg_strmap map.

Parameters

	in	req	Request handle.	
--	----	-----	-----------------	--

Returns

Reference to the client headers map.

Return values

```
NULL If req is null and sets the errno to EINVAL
```

Note

The headers map is automatically freed by the library.

5.5.4.20 sg_httpreq_cookies()

Returns the client cookies into sg_strmap map.

Parameters

in <i>req</i> Request handle.	in
-----------------------------------	----

Returns

Reference to the client cookies map.

Return values

```
NULL If req is null and sets the errno to EINVAL
```

Note

The cookies map is automatically freed by the library.

Examples:

example_httpcookie.c.

5.5.4.21 sg_httpreq_params()

Returns the query-string into sg_strmap map.

Parameters

_			
	in	req	Request handle.

Returns

Reference to the query-string map.

Return values

NULL	If req is null and sets the errno to EINVAL
------	---

Note

The query-string map is automatically freed by the library.

Examples:

example_httpuplds.c.

5.5.4.22 sg_httpreq_fields()

Returns the fields of a HTML form into sg_strmap map.

Parameters

```
in req Request handle.
```

Returns

Reference to the form fields map.

Return values

```
NULL If req is null and sets the errno to EINVAL
```

Note

The form fields map is automatically freed by the library.

5.5.4.23 sg_httpreq_version()

Returns the HTTP version.

Parameters

in	req	Request handle.

Returns

HTTP version as null-terminated string.

Return values

```
NULL If req is null and sets the errno to EINVAL.
```

5.5.4.24 sg_httpreq_method()

Returns the HTTP method.

Parameters

in	req	Request handle.
----	-----	-----------------

Returns

HTTP method as null-terminated string.

Return values

```
NULL If req is null and sets the errno to EINVAL.
```

5.5.4.25 sg_httpreq_path()

Returns the path component.

Parameters

in <i>req</i>	Request handle.
---------------	-----------------

Returns

Path component as null-terminated string.

Return values

```
NULL | If req is null and sets the errno to EINVAL.
```

Examples:

example_httpcookie.c.

5.5.4.26 sg_httpreq_payload()

Returns the posting payload into a sg_str instance.

Parameters

in req Request handle.

Returns

Instance of the payload.

Return values

```
NULL If req is null and sets the errno to EINVAL.
```

Note

The form payload instance is automatically freed by the library.

5.5.4.27 sg_httpreq_is_uploading()

```
bool sg_httpreq_is_uploading ( struct \ sg_httpreq * req )
```

Checks if the client is uploading data.

Parameters

in	req	Request handle.
----	-----	-----------------

Returns

true if the client is uploading data, false otherwise. If req is null, sets the errno to EINVAL.

Examples:

example_httpuplds.c.

5.5.4.28 sg_httpreq_uploads()

Returns the list of the uploaded files.

in	req	Request handle.

Returns

List of the uploaded files.

Return values

NULL	If req is null and sets the errno to EINVAL.
------	--

Note

The uploads list is automatically freed by the library.

Examples:

example_httpuplds.c.

5.5.4.29 sg_httpreq_set_user_data()

Sets user data to the request handle.

Parameters

in	req	Request handle.
in	data	User data pointer.

Return values

0	- Success.
EINVAL	- Invalid argument.

5.5.4.30 sg_httpreq_user_data()

Gets user data from the request handle.

in	req	Request handle.

Returns

User data pointer.

Return values

```
| NULL | If req is null and sets the errno to EINVAL.
```

5.5.4.31 sg_httpres_headers()

Returns the server headers into sg_strmap map.

Parameters

in res Response handle.

Returns

Reference to the server headers map.

Return values

```
NULL If res is null and sets the errno to EINVAL
```

Note

The headers map is automatically freed by the library.

5.5.4.32 sg_httpres_set_cookie()

```
int sg_httpres_set_cookie (
          struct sg_httpres * res,
          const char * name,
          const char * val )
```

Sets server cookie to the response handle.

in	res	Response handle.
in	name	Cookie name.
in	val	Cookie value.

Return values

0	- Success.
EINVAL	- Invalid argument.

Warning

It exits the application if called when no memory space is available.

Examples:

example_httpcookie.c.

5.5.4.33 sg_httpres_sendbinary()

Sends a binary content to the client.

Parameters

in	res	Response handle.
in	buf	Binary content.
in	size	Content size.
in	content_type	Content-Type of the content.
in	status	HTTP status code.

Return values

0	- Success.
EINVAL	- Invalid argument.
EALREADY	- Operation already in progress.

Warning

It exits the application if called when no memory space is available.

5.5.4.34 sg_httpres_sendfile()

```
size_t block_size,
uint64_t max_size,
const char * filename,
bool rendered,
unsigned int status)
```

Sends a file to the client.

Parameters

in	res	Response handle.
in	block_size	Preferred block size for file loading.
in	max_size	Maximum allowed file size.
in	filename	Path of the file to be sent.
in	rendered	If true the file is rendered, otherwise downloaded.
in	status	HTTP status code.

Return values

0	- Success.
EINVAL	- Invalid argument.
EALREADY	- Operation already in progress.
EISDIR	- Is a directory.
EBADF	- Bad file number.
EFBIG	- File too large.

Warning

It exits the application if called when no memory space is available.

Examples:

example_httpuplds.c.

5.5.4.35 sg_httpres_sendstream()

Sends a stream to the client.

in	res	Response handle.
in	size	Size of the stream.

Parameters

in	block_size	Preferred block size for stream loading.
in	read_cb	Callback to read data from stream handle.
in	handle	Stream handle.
in	free_cb	Callback to free the stream handle.
in	status	HTTP status code.

Return values

0	- Success.
EINVAL	- Invalid argument.
EALREADY	- Operation already in progress.

Note

Use size = 0 if the stream size is unknown.

Warning

It exits the application if called when no memory space is available.

5.5.4.36 sg_httpsrv_new2()

Creates a new HTTP server handle.

Parameters

in	auth_cb	Callback to grant/deny user access to the server resources.
in	auth_cls	User-defined closure for auth_cb.
in	req_cb	Callback to handle requests and responses.
in	req_cls	User-defined closure for req_cb.
in	err_cb	Callback to handle server errors.
in	err_cls	User-defined closure for err_cb.

Returns

New HTTP server handle.

Return values

```
NULL If the req_cb or err_cb is null and sets the errno to EINVAL.
```

Examples:

example_httpauth.c.

5.5.4.37 sg_httpsrv_new()

Creates a new HTTP server handle.

Parameters

in	cb	Callback to handle requests and responses.
in	cls	User-defined closure.

Returns

New HTTP server handle.

Return values

```
NULL If the cb is null and sets the errno to EINVAL.
```

Examples:

example_httpscookie.c, example_httpsrv.c, example_httpsrv_tls_cert_auth.c, and example_httpuplds.c.

5.5.4.38 sg_httpsrv_free()

Frees the server handle previously allocated by sg_httpsrv_new() or sg_httpsrv_new2().

in	srv	Pointer of the server to be freed.
----	-----	------------------------------------

Note

If the server is running it stops before being freed.

Examples:

example_httpauth.c, example_httpcookie.c, example_httpsrv.c, example_httpsrv_tls_cert_auth.c, and example_httpuplds.c.

5.5.4.39 sg_httpsrv_listen()

Starts the HTTP server.

Parameters

i	n	srv	Server handle.
i	n	port	Port for listening to connections.
i	n	threaded	Enable/disable the threaded model. If true, the server creates one thread per connection.

Returns

 $\verb|true| if the server| is started|, \verb|false| otherwise|. If \verb|srv| is null|, sets| the \verb|errno| to \verb|EINVAL|.$

Note

If port is 0, the operating system will assign randomly an unused port.

Examples:

example_httpauth.c, example_httpcookie.c, example_httpsrv.c, and example_httpuplds.c.

5.5.4.40 sg_httpsrv_shutdown()

```
int sg_httpsrv_shutdown (  struct \ sg_httpsrv * srv )
```

Stops the server not to accept new connections.

in	srv	Server handle.

Returns

0 if the server is stopped. If srv is null, sets the errno to EINVAL.

5.5.4.41 sg_httpsrv_port()

Returns the server listening port.

Parameters

in srv Server ha	ndle.
------------------	-------

Returns

Server listening port, 0 otherwise. If srv is null, sets the errno to EINVAL.

Examples:

example_httpauth.c, example_httpcookie.c, example_httpsrv.c, example_httpsrv_tls_cert_auth.c, and example_httpuplds.c.

5.5.4.42 sg_httpsrv_is_threaded()

```
bool sg_httpsrv_is_threaded ( struct \ sg_httpsrv \ * \ srv \ )
```

Checks if the server was started in threaded model.

Parameters

```
in srv Server handle.
```

Returns

true if the server is in threaded model, false otherwise. If srv is null, sets the errno to EINVAL.

5.5.4.43 sg_httpsrv_set_upId_cbs()

```
sg_write_cb write_cb,
sg_free_cb free_cb,
sg_save_cb save_cb,
sg_save_as_cb save_as_cb)
```

Sets the server uploading callbacks.

Parameters

in	srv	Server handle.
in	cb	Callback to handle uploaded files and/or fields.
in	cls	User-defined closure.
in	write_cb	Callback to write the stream of the uploaded files.
in	free_cb	Callback to free stream of the uploaded files.
in	save_cb	Callback to save the uploaded files.
in	save_as_cb	Callback to save the uploaded files defining their path.

Return values

0	- Success.
EINVAL	- Invalid argument.

5.5.4.44 sg_httpsrv_set_upld_dir()

Sets the directory to save the uploaded files.

Parameters

in	srv	Server handle.
in	dir	Directory as null-terminated string.

Return values

0	- Success.
EINVAL	- Invalid argument.

5.5.4.45 sg_httpsrv_upld_dir()

Gets the directory of the uploaded files.

Parameters

Returns

Directory as null-terminated string.

Return values

```
NULL If the srv is null and sets the errno to EINVAL.
```

5.5.4.46 sg_httpsrv_set_post_buf_size()

Sets a size to the post buffering.

Parameters

in	srv	Server handle.
in	size	Post buffering size.

Return values

0	- Success.
EINVAL	 Invalid argument.

5.5.4.47 sg_httpsrv_post_buf_size()

Gets the size of the post buffering.

Parameters

in	srv	Server handle.

Returns

Post buffering size.

Return values

0 If the srv is null and sets the errno to EINVAL.

5.5.4.48 sg_httpsrv_set_payld_limit()

Sets a limit to the total payload.

Parameters

in	srv	Server handle.
in	limit	Payload total limit.

Return values

0	- Success.
EINVAL	- Invalid argument.

5.5.4.49 sg_httpsrv_payld_limit()

Gets the limit of the total payload.

Parameters

in	srv	Server handle.

Returns

Payload total limit.

Return values

0 If the srv is null and sets the errno to EINVAL.

5.5.4.50 sg_httpsrv_set_uplds_limit()

```
\verb|int sg_httpsrv_set_uplds_limit (\\
```

```
struct sg_httpsrv * srv,
uint64_t limit )
```

Sets a limit to the total uploads.

Parameters

in	srv	Server handle.
in	limit	Uploads total limit.

Return values

0	- Success.
EINVAL	- Invalid argument.

5.5.4.51 sg_httpsrv_uplds_limit()

```
\label{limit} \begin{tabular}{ll} uint64\_t & sg\_httpsrv\_uplds\_limit ( \\ & struct & sg\_httpsrv * srv ) \end{tabular}
```

Gets the limit of the total uploads.

Parameters

in	srv	Server handle.

Returns

Uploads total limit.

Return values

```
0 If the srv is null and sets the errno to EINVAL.
```

5.5.4.52 sg_httpsrv_set_thr_pool_size()

Sets the size for the thread pool.

in	srv	Server handle.
in	size	Thread pool size.

Return values

0	- Success.
EINVAL	- Invalid argument.

5.5.4.53 sg_httpsrv_thr_pool_size()

Gets the size of the thread pool.

Parameters

in srv Server handle).
----------------------	----

Returns

Thread pool size.

Return values

```
0 If the srv is null and sets the errno to EINVAL.
```

5.5.4.54 sg_httpsrv_set_con_timeout()

Sets the inactivity time to a client get time out.

Parameters

in	srv	Server handle.
in	timeout	Timeout (in seconds).

Return values

0	- Success.
EINVAL	- Invalid argument.

5.5.4.55 sg_httpsrv_con_timeout()

```
unsigned int sg_httpsrv_con_timeout ( {\tt struct \ sg_httpsrv*srv})
```

Gets the inactivity time to a client get time out.

Parameters

in	srv	Server handle.
----	-----	----------------

Returns

Timeout (in seconds).

Return values

```
0 If the srv is null and sets the errno to EINVAL.
```

5.5.4.56 sg_httpsrv_set_con_limit()

Sets the limit of concurrent connections.

Parameters

in	srv	Server handle.	
in	limit	Concurrent connections limit.	

Return values

0	- Success.
EINVAL	- Invalid argument.

5.5.4.57 sg_httpsrv_con_limit()

Gets the limit of concurrent connections.

in	srv	Server handle.

Returns

Concurrent connections limit.

Return values

```
0 If the srv is null and sets the errno to EINVAL.
```

5.5.4.58 sg_httpread_end()

Returns a value to end a stream reading processed by sg_httpres_sendstream().

Parameters

in	err	true to return a value indicating a stream reading error.
----	-----	---

Returns

Value to end a stream reading.

6 Data Structure Documentation

6.1 sg_httpauth Struct Reference

```
#include <sagui.h>
```

6.1.1 Detailed Description

Handle for the HTTP basic authentication.

Examples:

```
example_httpauth.c.
```

The documentation for this struct was generated from the following file:

• sagui.h

6.2 sg_httpreq Struct Reference

```
#include <sagui.h>
```

6.2.1 Detailed Description

Handle for the request handling. It contains headers, cookies, query-string, fields, payloads, uploads and other data sent by the client.

Examples:

```
example\_httpauth.c, \quad example\_https:v.c, \quad example\_https:v.c, \quad example\_https:v.c, \quad example\_https:v.c, \quad and \quad example\_httpuplds.c.
```

The documentation for this struct was generated from the following file:

• sagui.h

6.3 sg_httpres Struct Reference

```
#include <sagui.h>
```

6.3.1 Detailed Description

Handle for the response handling. It dispatches headers, contents, binaries, files and other data to the client.

Examples:

example_httpauth.c, example_httpcookie.c, example_httpsrv.c, example_httpsrv_tls_cert_auth.c, and example_httpuplds.c.

The documentation for this struct was generated from the following file:

· sagui.h

6.4 sg_httpsrv Struct Reference

```
#include <sagui.h>
```

6.4.1 Detailed Description

Handle for the fast event-driven HTTP server.

Examples:

```
example_httpauth.c, example_httpcookie.c, example_httpsrv.c, example_httpsrv_tls_cert_auth.c, and example_httpuplds.c.
```

The documentation for this struct was generated from the following file:

· sagui.h

6.5 sg_httpupId Struct Reference

```
#include <sagui.h>
```

6.5.1 Detailed Description

Handle for the upload handling. It is used to represent a single upload or a list of uploads.

Examples:

```
example\_httpuplds.c.
```

The documentation for this struct was generated from the following file:

sagui.h

```
#include <sagui.h>
```

6.6.1 Detailed Description

Handle for the string structure used to represent a HTML body, POST payload and more.

Examples:

```
example_httpuplds.c, and example_str.c.
```

The documentation for this struct was generated from the following file:

· sagui.h

6.7 sg_strmap Struct Reference

```
#include <sagui.h>
```

6.7.1 Detailed Description

Handle for hash table that maps name-value pairs. It is useful to represent posting fields, query-string parameter, client cookies and more.

Examples:

example_httpcookie.c, example_httpuplds.c, and example_strmap.c.

The documentation for this struct was generated from the following file:

• sagui.h

8.4 example_httpsrv_tls_cert_auth.c

Simple client-side certificate authentication using GnuTLS.

```
#include <stdlib.h>
#include <stdio.h>
#include <errno.h>
#include <gnutls/gnutls.h>
#include <gnutls/x509.h>
#include <sagui.h>
/* NOTE: Some error checking has been omitted for clarity. */
* Simple example using TLS client authentication.
 * Client example using cURL:
 * curl -k --cert certs/client.p12 --pass abc123 --cert-type p12 https://localhost:<PORT>
 * Certificate generation:
 * certtool --generate-privkey --outfile ca.key

* echo 'cn = GnuTLS test CA' > ca.tmpl
 * echo 'ca' >> ca.tmpl
 * echo 'cert_signing_key' >> ca.tmpl
* echo 'expiration_days = 3650' >> ca.tmpl
 * certtool --generate-self-signed --load-privkey ca.key --template ca.tmpl --outfile ca.pem
 * ## Server
 * certtool --generate-privkey --outfile server.key
 * echo 'organization = GnuTLS test server' > server.tmpl
 * echo 'cn = test.gnutls.org' >> server.tmpl
 * echo 'tls_www_server' >> server.tmpl
 * echo 'cxpiration_days = 3650' >> server.tmpl

* certtool --generate-certificate --load-ca-privkey ca.key --load-ca-certificate ca.pem --load-privkey
       server.key --template server.tmpl --outfile server.pem
* ## Client
 * certtool --generate-privkey --outfile client.key
 * echo 'cn = GnuTLS test client' > client.tmpl
 * echo 'tls_www_client' >> client.tmpl
 * echo 'expiration_days = 3650' >> client.tmpl
 * certtool --generate-certificate --load-ca-certificate ca.pem --load-ca-privkey ca.key --load-privkey
      client.key --template client.tmpl --outfile client.pem
 * certtool --to-p12 --p12-name=MyKey --password=abc123 --load-ca-certificate ca.pem --load-privkey
      client.key --load-certificate client.pem --outder --outfile client.p12
